Since the body is made up of various substances with differing densities, X-rays can be used to reveal the internal structure of the body on film by highlighting these differences using attenuation, or the absorption of X-ray photons by the denser substances (like calcium-rich bones). The discipline involving the study of anatomy through the use of radiographic films is known as radiographic ...

Dental radiographs are commonly called X-rays. Dentists use radiographs for many reasons: to find hidden dental structures, malignant or benign masses, bone loss, and cavities.. A radiographic image is formed by a controlled burst of X-ray radiation which penetrates oral structures at different levels, depending on varying anatomical densities, before striking the film or sensor.

OBJECTIVE. The purpose of this article is to show the important radiographic criteria that indicate the two types of femoroacetabular impingement: pincer and cam impingement. In addition, potential pitfalls in pelvic imaging concerning femoroacetabular impingement are shown. CONCLUSION. Femoroacetabular impingement is a major cause for early "primary" osteoarthritis of the hip.

The skeletal anatomy of the hip provides two main sources for impingement: abnormal contact between the acetabulum and femur or between the ischium and femur. Femoroacetabular impingement is a potential cause of hip pain and labral and osseous abnormalities []. On the other hand, ischiofemoral impingement has been rarely described in the medical literature and remains a disputed entity [].
